

# Supporting AntiMatter's Deployments & Customer Operations

March 2026 — Josselin Raguenet de Saint Albin

## 1. Context and intent

AntiMatter is being created as a vertically integrated “Neo Cloud” player, spanning the full chain from energy to high-performance compute and software orchestration. Data Factory brings industrial-scale power farms in Texas, with a pipeline of more than 160 MW, sub-50\$/MWh energy costs thanks to sophisticated 4CP and curtailment management, and 4.3 M\$ of cumulative EBITDA in 2025. It is already transitioning from being perceived as a “Bitcoin mining” company to a broader HPC and AI compute provider, including pilots with PoliCloud containers on existing sites.

PoliCloud adds modular, sovereign GPU mini-datacenters that can be deployed quickly in regulated markets, particularly in Europe, while Hivenet can contribute the distributed storage and orchestration layer binding energy, hardware and workloads into a single operational fabric. The ambition outlined to investors is clear: deploy 1,000+ PoliCloud nodes (100,000+ GPUs) within 36 months, with a path to 10,000 nodes, and exceed 100 M\$ in annual revenue in 24 months, leveraging profitable, cash-flow-positive operations. Governance is organised around a strong executive leadership (David Gurlé as Executive Chairman & CEO/CTO/CPO, Bastien Vidal as CFO) and three business units led by Guillaume Goualard (Data Factory), Queenie Chan (Hivenet) and an interim-run PoliCloud until an external leader is recruited in 2026.

My intent with this note is to outline how I could practically support AntiMatter over the next 12–18 months on two fronts:

- Industrialising deployments (with a focus on PoliCloud roll-outs and their integration with Data Factory and Hivenet).
- Structuring the customer-facing and operational backbone at group level (SLA, incident management, feedback loops, KPIs).

I write this as both an operator and an individual small investor in Data Factory who has committed a meaningful share of his savings to the project, and who has been following the project since Richard has made it public.

---

## 2. Where I believe I can help

My background is in building and scaling operations and customer organisations in complex, multi-country environments, mostly in periods of rapid growth.

- **TLScontact (Teleperformance)** – Regional Manager Africa: set up and ran operations across 17 African countries, creating +20 new service centres end-to-end (legal entities, leases and fit-out, staff hiring and training, Ops + IT and security), managing a regional P&L of ~7 M€ OPEX and 300+ staff, in a phase of hyper-growth and constant reorganisation.
- **Meero** – Head of Customer Service then Global Head of Support Operations: built a global customer organisation from scratch, scaled to 70+ FTE across 4 hubs (Paris,

NYC, Tokyo, Bangalore), offshored and outsourced parts of the activity, and reduced departmental costs by 80% while maintaining 24/7 multi-timezone coverage in a fast scale-up context.

- **Malt** – Global Director Community Success & Care: designed and deployed acquisition, activation, retention and support operations for a community of 400k+ freelancers, structuring teams across 7 European countries and implementing Salesforce-based processes and performance dashboards during a high-growth phase.
- **Gadimat** – I joined my family's business in Morocco (wood imports) as Deputy to the CEO: launching a new activity for the company and responsible for its P&L: a furniture factory/ I oversaw production and sales processes. Along that I led several transversal projects across the company: digitisation of invoicing, HR & admin processes; optimisation of a 20-truck logistics fleet; automation PoC for inventories & stock management.

Across TLScontact, Meero and Malt, I have mostly operated in high-growth phases: new countries or sites opening every quarter, headcount scaling fast, and organisations being constantly re-shaped. I am used to environments where action comes first, but where you still need to design processes, teams and systems that will not break at the next order of magnitude.

This combination – large-scale site roll-outs, industrial operations, and global customer/success/deployment organisations – is highly aligned with what AntiMatter must now execute: scaling physical infrastructure, integrating new product layers (GPU, distributed storage, orchestration), and delivering reliable service to demanding HPC/AI customers.

---

### **3. 12–18 month execution priorities where I'd contribute**

#### **3.1. Industrialise PoliCloud deployments as a global “playbook”**

You have already started piloting PoliCloud units on Data Factory sites in Rockdale and Rio Grande City, with a view to demonstrating distributed redundancy and dynamic energy-aware failover. The next step is less about proving the concept and more about turning it into a repeatable deployment machine across hundreds of sites worldwide.

I see four streams where I could take the lead under your direction, working with existing teams and helping you hire a small cross-functional deployment squad as needed.

**1. Deployment playbook and governance**

- Define a standard end-to-end deployment process for a PoliCloud node, from site selection and design to energisation, GPU turn-up and handover to run teams.
- Establish clear RACI across Data Factory (grid and physical sites), PoliCloud (containers, cooling, on-site hardware), Hivenet (software stack and orchestration) and local partners.
- Set up deployment review cadences (weekly portfolio reviews, stage-gates, risk lists) for the pipeline of 1,000 nodes, incorporating constraints from TDSPs, hardware lead times and financing.

**2. Site readiness and integration with Data Factory**

- Work with Guillaume and his teams on a standard “site readiness” checklist for GPU-capable infrastructure: power, cooling, network, physical security, and space for PoliCloud units.
- Ensure ERCOT-specific operational insights (4CP management, curtailment, weather risk) are baked into deployment plans for PoliCloud-equipped sites in Texas.
- Coordinate interfaces between Data Factory's energy management stack (including Synota-enabled automated billing flows) and PoliCloud's revenue models for compute, so that energy usage and cost data consistently feed into internal unit-economics and customer billing.

**3. Global rollout logistics and local partners**

- For deployments beyond Texas and North America, design a model to leverage local partners (electrical contractors, civil works, telco providers), balancing standardisation with regulatory and cultural differences.
- Define templates for contracts, SLAs and supervision tooling to keep quality and safety consistent while scaling geography, especially in more regulated European markets where PoliCloud's sovereign angle will be key.

**4. Deployment KPIs and dashboards**

- Build simple, actionable dashboards tracking the deployment funnel: nodes in design, permitting, construction, energisation, GPU ready, and revenue live, with timelines and costs per stage.
- Tie these KPIs back to financial models (CAPEX per node, time-to-revenue, ramp-up curves), so Bastien's team and BU heads can see execution risks early and adjust capital allocation accordingly.

In practice, I would expect to spend targeted time on the ground at key milestones (kick-off, go-live, post-mortem) in Texas and other priority markets, while being primarily based in Europe. This would allow me to stay close to PoliCloud and Hivenet's European developments and to the regulatory and energy stakeholders there, and to translate field reality into processes and dashboards for the executive team.

## **3.2. Structure the group-level “Customer & Ops” backbone**

Your investor materials highlight strong operational discipline and positive cash flows across the three entities. As AntiMatter scales, customer experience and reliability will be as critical as raw GPU count or energy costs, especially for regulated, sovereign or AI-critical workloads.

Here, my contribution would focus on building a coherent customer and operations backbone across units:

### **1. SLA and incident management framework**

- Design standard SLAs and SLOs for different customer segments (HPC tenants, AI training/inference, storage), capturing uptime, performance, energy-related constraints and support responsiveness.
- Implement a unified incident management process: detection, triage, communication, root-cause analysis, and remediation tracking, integrating inputs from Data Factory, PoliCloud and Hivenet.

### **2. Customer-facing processes and teams**

- Work with sales (e.g. PoliCloud's VP Sales) and existing Chiefs of Staff to structure how new customers are onboarded, supported and grown across the stack.
- Where relevant, help define or refine roles for support, success and technical account management, prioritising lean, high-leverage setups at this stage. Wherever there is a gap, my role would be to help you define the right profiles (support leads, deployment PMs, customer success managers) and to hire and coach them, so that AntiMatter's customer operations can scale beyond what any single person could handle.

### **3. Feedback loop into product and strategy**

- Establish simple mechanisms so that what deployment and customer teams see in the field (bottlenecks, feature requests, regulatory friction) is systematically captured and fed into product/engineering and into your strategic decisions.
- Use regular “field review” sessions with BU heads (Guillaume, Queenie, future PoliCloud leader) to surface non-obvious patterns that might affect site selection, product roadmap or go-to-market.

### **4. Operational KPIs for AntiMatter as a whole**

- Propose a concise, standardised set of operational KPIs at group level: capacity deployed and live (MW, number of nodes, GPUs), time-to-deploy, utilisation rates, energy cost per kWh, incidents per node, customer satisfaction, and basic unit economics per segment.
- Work with Bastien and each BU leader to ensure financial reporting and operational reporting talk to each other, not past each other.

### 3.3. Operate as a “senior glue” between executive team and BUs

You have explicitly structured AntiMatter around three business units with a central executive team (David as CEO/CTO/CPO; Bastien as CFO; board oversight), and plan additional senior hires in 2026.

Given this, I would position myself not as a fourth BU head or a competing Chief of Staff, but as a senior operator whose job is to:

- Own and drive a few transversal execution topics (PoliCloud deployment playbook, group-level SLAs, key operational KPIs).
- Spend time both in the field and at the “executive team” level, ensuring information and priorities flow cleanly between board decisions, financial constraints and on-the-ground realities.
- Take on some of the operational complexity that would otherwise land on your, Guillaume's or Queenie's plate, while **building and coordinating the small team that will own these topics long term**, so you are not dependent on me as an individual contributor.

I am comfortable reporting directly to David, with dotted-line collaboration to BU leaders and Bastien, and adjusting scope as AntiMatter's leadership team expands.

---

## 4. How I suggest we proceed

If this direction resonates, a concrete next step could be:

1. A 45–60 minute discussion focused on your current view of execution priorities for the next 12–18 months, including what is already owned by existing team members.
2. A short follow-up where I refine this proposal into a more precise role description and a 90-day action plan you can react to or challenge.
3. If alignment is strong, a trial period or project-based collaboration focused on one or two high-impact streams (for example: standardising PoliCloud deployments from the Texas pilots; designing group-level SLAs and incident management for the first wave of HPC/AI customers).

My goal is to be useful quickly – by absorbing real operational work at the beginning, bringing my experience of past scale-ups, and structuring a small, high-leverage team around these topics – and to adapt the exact title and perimeter to what best complements the executive team and business units you are assembling.

Thank you for your attention!
